Receipt is acknowledged of the Amendment filed December 27, 2004.

Reasons for Allowance

Claims 1-14 are allowable over the prior art of record.

The following is an examiner's statement of reasons for allowance: the best prior art of record, Martin et al., taken alone or in combination of other references, does not teach or fairly suggest a method or a latch array comprising, among other things, a second conductive line, the second conductive line being directly connected to the output of the buffer and to the output of the second latch, wherein when the drive enable is asserted, the buffer drives the output of the first latch such that signal integrity of the output of the first latch is ensured, and wherein when the drive enable is not asserted, the tri-state buffer exhibits high output impedance that isolates the second latch from the first latch (claims 1 and 10); a second tri-state buffer comprised by the second section, the second tri-state buffer having an input, an output and a drive enable, each output of each latch of the second section being connected to a second conductive line, which is connected to the input of the second tri-state buffer, each output of each latch of the third section being connected to a third conductive line, the third conductive line being connected to the output of the second tri-state buffer (claims 2 and 11); and M tri-state buffers, M being a positive integer that is less than N, each of N-M of the sections comprising at least one of M tri-state buffers, and wherein the sections that comprise the tri-state buffers are each a sufficient distance away from an output of the column that a driving strength of the buffer of the section is needed to ensure signal integrity of signals output from the latches of the N-M sections (claim 6), as set forth in the claims.
